and Science Systems and Applications, Inc.

17 September 2008

17 September 2008 Starting on 11 September 2008, a series of bad IR data sets contaminated 3B41RT and 3B42RT. Data files for 16 3B41RT times and 9 3B42RT times have been recomputed and users should re-pull the entire interval of data 21 UTC 11 September – 12 UTC 15 September. As well, the errors contaminated the microwave-IR calibration. The relevant period of data were dropped from the calibration, but users should be aware that this fix will somewhat affect results until mid-October.

5 September 2008 Selected hours of IR data as processed in real time were defective for selected hours on 2, 4, 5 August and 4 September. The corresponding 3B41RT estimates were deleted and corresponding 3B42RT files were recomputed without IR. Additionally, the last recorder on board the DMSP F14 failed late on 23 August 2008, effectively ending its SSM/I data record.

21 June 2008 A server problem at NOAA prevented the timely transmission of the CPC Merged IR product from 21 UTC 19 June 2008 through 14 UTC 20 June 2008. As of about 1330 UTC 21 June the IR data had been back-filled from CPC and re-run. So, users should re-pull 3B41RT and 3B42RT if they have gaps in their local archive for that interval due to pulling the data before we could make it available. As a separate problem, much of the 21 UTC 20 June 2008 IR field contained artifacts, so the 3B41RT and 3B42RT for that time have artifacts. This problem will be corrected, likely on 23 June.

6 June 2008 Due to administrative changes related to upgrading TSDIS to PPS--, the site tsdis03 is no longer public; <ftp://trmmopen.gsfc.nasa.gov> continues as the primary site for accessing 3B4xRT data.

5 June 2008 Hardware maintenance caused disruption to the NOAA/CPCP Merged IR data for parts of 1-2 June 2008, so some 3B41RT files are missing and some 3B42RT files are microwave-only. The 00Z 5 June 2008 IR field was faulty due to communication issues; Both 3B41RT and 3B42RT were deleted and recomputed.

22 May 2008 Server crashes within NOAA prevented transmission of IR data for the period 21 UTC on 20 May 2008 to 13 UTC on 21 May. The affected 3B41RT and 3B42RT files have now been computed.

1 May 2008 Server configuration problems within NOAA caused faulty IR data to contaminate the 01 and 09 UTC 30 April 2008 3B41RT files and the 09 UTC 30 April 2008 3B42RT. The

first two were deleted, while the third was recomputed from 3B40RT alone. Users who pulled the initial contaminated files should delete (3B41RT) or re-pull (3B42RT) the affected files.
